

Homework 8

A.

i) $\sum_{n=1}^{\infty} \cos^n(2)$

Ratio test

$$\lim_{n \rightarrow \infty} \frac{\cos^{n+1}(2)}{\cos^n(2)} = \lim_{n \rightarrow \infty} \frac{\cos^n(2) \cdot \cos(2)}{\cos^n(2)} = \lim_{n \rightarrow \infty} \cos(2) \approx 0.9939$$

$\cos(2) < 1$, $\therefore \sum_{n=1}^{\infty} \cos^n(2) \rightarrow$ converges (to 1)

ii) $\sum_{n=1}^{\infty} \frac{1}{n^2+3n}$

$$\frac{1}{n^2+3n} < \frac{1}{n^2}$$

Since, $\sum_{n=1}^{\infty} \frac{1}{n^2}$ converges, by direct comparison test

$\sum_{n=1}^{\infty} \frac{1}{n^2+3n}$ also converges (to 1)

iii) $\sum_{n=1}^{\infty} (\sqrt{n+1} - \sqrt{n})$

$$\sqrt{n+1} - \sqrt{n} = \frac{\sqrt{n+1} - \sqrt{n}}{1} = \frac{n+1 - n}{\sqrt{n+1} + \sqrt{n}} = \frac{1}{\sqrt{n+1} + \sqrt{n}}$$

$$\lim_{n \rightarrow \infty} \frac{\frac{1}{\sqrt{n+1} + \sqrt{n}}}{\frac{1}{\sqrt{n}}} = \lim_{n \rightarrow \infty} \frac{\sqrt{n}}{\sqrt{n+1} + \sqrt{n}} = \frac{1}{2}$$

$$= \lim_{n \rightarrow \infty} \frac{\sqrt{n}}{\sqrt{\frac{n}{n} + 1} + \sqrt{\frac{n}{n}}} = \lim_{n \rightarrow \infty} \frac{1}{\sqrt{1+1} + 1} = \lim_{n \rightarrow \infty} \frac{1}{2} = \frac{1}{2}$$

$0 < \frac{1}{2} < \infty$, $\therefore \sum_{n=1}^{\infty} \sqrt{n+1} - \sqrt{n}$ is equi-convergent
to $\sum_{n=1}^{\infty} \frac{1}{\sqrt{n}}$, so both diverge

8 i) $\sum_{n=1}^{\infty} \frac{\sin^2(n)}{2n^2+1} \leq \sum_{n=1}^{\infty} \frac{1}{2n^2}$

$$0 \leq \sin^2(n) \leq 1$$

$$2n^2+1 \geq 2n^2 \Rightarrow \frac{1}{2n^2+1} \leq \frac{1}{2n^2} \leq \frac{1}{n^2}$$

By direct comparison test, since $\sum_{n=1}^{\infty} \frac{1}{n^2}$ converges, then $\sum_{n=1}^{\infty} \frac{\sin^2(n)}{2n^2+1}$ also converges

ii) $\sum_{n=1}^{\infty} \frac{1}{(n^2-\pi)}$

$$\lim_{n \rightarrow \infty} \frac{1}{\frac{n^3-\pi}{n^3}} = \lim_{n \rightarrow \infty} \frac{n^3}{n^3-\pi} \stackrel{1 \cdot \infty}{=} \lim_{n \rightarrow \infty} \frac{1}{1-\frac{\pi}{n^3}} = 1$$

~~Since $\sum_{n=1}^{\infty} \frac{1}{n^3}$ converges, then $\sum_{n=1}^{\infty} \frac{1}{n^3-\pi}$ also converges~~

$$0 < 1 < \pi$$

Since $\sum_{n=1}^{\infty} \frac{1}{n^3}$ converges, then $\sum_{n=1}^{\infty} \frac{1}{n^3-\pi}$ also converges (they are equiconvergent)

iii) $\sum_{n=1}^{\infty} \frac{n-1}{n^2-1}$

$$\frac{n-1}{n^2-1} = \frac{n-1}{(n-1)(n+1)} = \frac{1}{n+1} < \frac{1}{n}$$

$$\lim_{n \rightarrow \infty} \frac{\frac{n-1}{n^2-1}}{\frac{1}{n}} = \lim_{n \rightarrow \infty} \frac{n(n-1)}{(n-1)(n+1)} = \lim_{n \rightarrow \infty} \frac{n}{n+1} \stackrel{1 \cdot \infty}{=} \lim_{n \rightarrow \infty} \frac{\frac{n}{n}}{\frac{n}{n} + \frac{1}{n}} = 1$$

$$= \lim_{n \rightarrow \infty} \frac{1}{1+0} = 1 \quad 0 < 1 < \infty$$

$\sum_{n=1}^{\infty} \frac{1}{n}$ is equiconvergent to $\sum_{n=1}^{\infty} \frac{n-1}{n^2-1}$ (they both diverge)

(C) $\sum_{n=1}^{\infty} a_n \rightarrow$ convergent series, b_n -bounded, nonnegative sequence
 $0 \leq b_n \leq M$ (positive, bounded)

$$\sum_{n=1}^{\infty} a_n \cdot b_n < \sum_{n=1}^{\infty} a_n \cdot M$$

$\sum_{n=1}^{\infty} a_n \cdot M \rightarrow$ converges (by Arithmetic of series for all $M \neq 0$)
 (A.M)

Therefore by direct comparison test, $\sum_{n=1}^{\infty} a_n \cdot b_n$ also converges.

(D) if $a_n = 4n^3 - 23n^2 + 4n - 1$, then $a_n = \Theta(n^3)$

$$\frac{n^3}{2} \ominus 4n^3 \ominus 5n^3$$

$$\frac{n^3}{2} \ominus 23n^2 \ominus 5n^3$$

$$\frac{n^3}{2} \ominus 4n \ominus 5n^3$$

$$\frac{n^3}{2} \ominus 1 \ominus 5n^3$$

for $n \geq 1$

$$4n^3 \ominus n^3$$

$$23n^2 \ominus n^3$$

$$4n \ominus n^3$$

$$1 \ominus n^3$$

(E) if $\lim_{n \rightarrow \infty} a_n = 0$, then $\Theta(a_{n+1}) = \Theta(1)$

$$\lim_{n \rightarrow \infty} a_n = 0$$

$$\Rightarrow \lim_{n \rightarrow \infty} a_{n+1} = 1 \text{ (by Aob)}$$

$$\lim_{n \rightarrow \infty} 1 = 1$$

$$\frac{a_{n+1}}{2} < a_{n+1} < 2(a_{n+1})$$

$$\frac{1}{2} < 1 < 2$$

$$\left[\alpha = \frac{1}{2} \quad \beta = 2 \right] \Rightarrow \text{For both}$$

$\sum_{n=1}^{\infty} 2$ diverges, $\therefore \sum_{n=1}^{\infty} 1$ and $\sum_{n=1}^{\infty} a_{n+1}$ both

diverge, (are equivalent)
