

## University of Primorska UP FAMNIT Academic year 2021/2022

## Algebra I EXAM - FEBRUARY 10, 2023 -

Time: 135 minutes. Maximum number of points: 100. You are allowed to use a pen and a calculator. Write clearly, and justify all your answers. Good luck!

- 1. (a) Write the definition of the scalar (dot) product and state at least 3 of its properties. Then, prove the following statement: For any two vectors  $\overrightarrow{u}$ ,  $\overrightarrow{v} \in \mathbb{R}^3$ , it holds that  $\langle \overrightarrow{u}, \overrightarrow{v} \rangle = |\overrightarrow{u}||\overrightarrow{v}|\cos\varphi$ , where  $\varphi$  is the angle between vectors  $\overrightarrow{u}$  and  $\overrightarrow{v}$ . (7 points)
  - (b) In  $\mathbb{R}^3$ , derive the equation of a line in vectorial, parametric and canonical form. (6 points)
  - (c) Write down and prove Cramer's rule for solving systems of linear equations. (7 points)
- 2. (a) Let the vectors  $\overrightarrow{v}$  and  $\overrightarrow{u}$  be given as  $\overrightarrow{v}=t\overrightarrow{a}+17\overrightarrow{b}$  and  $\overrightarrow{u}=3\overrightarrow{a}-\overrightarrow{b}$ . Find all values of the parameter  $t\in\mathbb{R}$  for which the vectors  $\overrightarrow{v}$  in  $\overrightarrow{u}$  are orthogonal, using the facts that  $|\overrightarrow{a}|=2, |\overrightarrow{b}|=5$  and  $\measuredangle(a,b)=\frac{2\pi}{3}$ .
  - (b) Are the vectors  $\overrightarrow{a}=(-1,3,2)$ ,  $\overrightarrow{b}=(2,-3,-4)$  and  $\overrightarrow{c}=(-3,12,6)$  co-planar? If yes, write  $\overrightarrow{c}$  as a linear combination of  $\overrightarrow{a}$  and  $\overrightarrow{b}$ .
- 3. We are given lines  $\ell = (7,0,1) + \lambda(2,1,-2)$  and q: x+3=4-4y=20-4z.
  - (a) Find the intersection of lines  $\ell$  and q.

(7 points)

(b) Find the equation of the plane containing lines  $\ell$  and q.

(7 points)

(c) Compute the angle between lines  $\ell$  and q.

(6 points)

4. Find the values of a and b for which the system of linear equations

$$x + ay + z = 3$$
$$x + 2y + 2z = b$$
$$x + 5y + 3z = 9$$

is consistent. Under which condition will this system have a unique solution (write the solution)? (20 points)

5. Show that the determinant of the  $n \times n$  matrix

$$\begin{bmatrix} 3 & 2 & 0 & \cdots & 0 & 0 & 0 \\ 1 & 3 & 2 & \cdots & 0 & 0 & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots & \vdots & \vdots \\ 0 & 0 & 0 & \cdots & 1 & 3 & 2 \\ 0 & 0 & 0 & \cdots & 0 & 1 & 3 \end{bmatrix}$$

is equal to  $2^{n+1} - 1$ .
