- Let an be a seq. of positive real numbers.

Need to prove:

al an has a subseq. that converge

6) by has a subseque that diverge to A

Proof of al Suppose that an is bounded. Then

there exists real number Mzo S.t. an M for all nEN.

In that case, the seq. an is bounded of positive real numbers. B With this, by Bolzano-Weierstrass theorem, an has a convergent subseq. ank. This concludes that the subseq. (ank) converges. Cin this casel

Proof of 6) Suppose that an is unbounded. Then

I subseq. and of an s.t. and -> as K-> a.

This concludes that the subseq. (and) diverges to a. (in this case).

i)
$$\sum (4^n + 2^n)/3^n = \frac{4^n + 2^n}{3^n}$$
By applying ratio test, we have

By applying ratio test, we have
$$\frac{a_{n+1}}{a_n} = \frac{\frac{4^{n+1}}{3^{n+1}}}{\frac{4^n}{3^n}} + \frac{\frac{2^{n+1}}{3^{n+1}}}{\frac{2^n}{3^n}} = \frac{1}{1} + \frac{1}{1} = 2 > 1 = 7$$
diverges

The seq. $sin^{n}(3)$ $Z r^{n} = \frac{1}{1+c}$ if |c| < 1 and sin < 3 > 0, 14

Since $\sum_{n=1}^{\infty} \frac{1}{n^2 + 2n}$ also converges, by direct comparison test we have that $\sum_{n=1}^{\infty} \frac{1}{n^2 + 2n}$ also converges, to 1.

iv) $\sum (\sqrt{n+2} + \sqrt{n})$ = $\frac{1}{\sqrt{n+2} + \sqrt{n}} = \frac{1}{\sqrt{n+2} + \sqrt{n}} = \frac{2}{\sqrt{n+2} + \sqrt{n$

C. For each of the following series, determine whether the series converges, diverges to two, or diverges, not to 100. Don't try to find what the series converge to.

i) $\sum \sin^2(3n+2)/(2n^2-3)$, $a_n = \sin^2(3n+2)/(2n^2-3)$

we define $6n = \frac{1}{n^2} \frac{3.3 \text{ and it}}{2n^2 - 3}$ if $\frac{3}{3.4} \frac{3 \text{ non verges}}{4n^4 - 12n^2 + 9} \frac{3.5}{3.5} \frac{4}{3.6}$ lim $\frac{4n}{6n} = \lim_{n \to \infty} \frac{3 \cdot n^2}{2n^2 - 3} \frac{3 \cdot n^2}{2n^2 - 3} \frac{3 \cdot n^2}{2n^2 - 3} = \lim_{n \to \infty} \frac{n^2 (9n^2 + 12n + 4)}{4n^4 - 12n^2 + 9} = \frac{9}{3.5}$

that means that Zan and Zon have the same nature, and Zan is convergent.

Ann- 2nt 2(nt2) = 2nt9 Now we compate the limit: -7 Lim 20 + 1 = lim 25 + 12 = 2 = 2 >0 , which means 2 an = + 0

ii] Z (-31"/(3 n2 + 6") : First we use comparison test, we get: $|a_n| = \left| \frac{(3)^n}{3n^2+6^n} \right| = \frac{3^n}{3n^2+6^n}$ $\int ar 3n^2+6^n > 6^n/2 =) \frac{1}{3n^2+6n} < \frac{1}{6^n} | \cdot 3^n = 7 \frac{3^n}{3n^2+6^n} < \frac{3^n}{6^n}$ $6_{1} = \frac{3}{(2)^{1/2}} = \left(\frac{1}{2}\right)^{1/2} = \frac{1}{4.4}$

? Now we use route test (From Tutorials), and jet and = 2nt1 = 1 = 1 = 1 = 1 × 7, which means the seq. is convergent = 2 Since by is convergent, |a, | absolutely converges by comparison test.

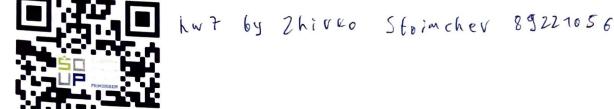

iii) $\sum (-4)^n / (4^n \sqrt{2n+1}) \sim \sum \frac{(-1)^n \sqrt{4^n}}{\sqrt{4^n} \sqrt{2n+1}} = \sum \frac{(-1)^n}{\sqrt{2n+1}}$ with absolute value, we have $\sum \frac{1}{\sqrt{2n+1}} \sim \sum 6n = \frac{1}{7n}$ we new compate $\lim_{n \to \infty} \frac{a_n}{6n} = \lim_{n \to \infty} \frac{1}{6n} = \lim_{n \to \infty} \frac{1}{\sqrt{2n+1}} = \lim_{n \to$

now ove can see that E an and I an have same nature, which

 $\frac{\text{means they are divergent.}}{2 \frac{(-1)^n}{4^n \sqrt{2n+1}}} = \frac{1}{2} \frac{(-1)^n}{\sqrt{2n+1}}$

 $a_n = \sqrt{\frac{1}{2n+1}}$ and $\lim_{n\to\infty} a_n = \lim_{n\to\infty} \frac{1}{\sqrt{2n+3}} < a_n = \frac{1}{\sqrt{2n+3}}$

a trow there we conclude that Z(-11" the is divergent

E. Show that if $a_n = 5n^3 - 14n^2 + 7n - 3$, then $a_n = \Phi(n^3)$ $\exists d > 0$ and $\exists \beta > 0$, $\exists N$ s.t. $\forall n > N$ $d n^3 \leq 5n^3 - 14n^2 + 7n - 3 \leq \beta n^3$ $1 \cdot n^3 \leq 5n^3 - 14n^2 + 7n - 3 \leq 5n^2 + 14n^3 + 7n^3 + 3n^2 = 23n^3$ that is equivalen & with $0 \leq 4n^3 - 14n^2 + 7n - 8$ from what we get $14n^2 - 4n + 3 \leq 4n^3$

New are show that $\exists N=10$ and $\forall n>N$, it holds. $\exists d=1$ and $\exists \beta=2$? $\exists N=10 \ \ N>N$ $d-\beta_n \leq q_n \leq \beta \cdot b_n$

What about conditional convergence? Try using AST. This series in fact converges conditionally.
