

Lw4 by Zhivko Stoimcher

 $N = \frac{10}{96} - \frac{5}{3}$

All Using Arithmetic of Limits, find limin/Bonts il Working directly from the definition of Limits, give a direct verification that your answer in lil is correct (Your answer should involve the letter E).

i)
$$\lim_{n\to\infty} \frac{2n}{3n+5} = \lim_{n\to\infty} \frac{2n}{4n+3}$$

Since, 2,3, $\frac{5}{n}$ are convergent, we can apply AoL. and we get $\frac{2}{3}$ * $\lim_{n\to\infty} \frac{2n}{3n+5} = \frac{2}{3}$ *

ii) Discussion: For each & 20 we need to decide how big n mast be to generate that $\left|\frac{2n}{3n+5} - \frac{2}{3}\right| < \xi$ (aka find N)

Since 3(3n+s) 70, we can drop the absolute value and manipulate the expression.

3(3nfs)
$$= 7 \frac{10}{9E} - \frac{5}{3} < n = 7 \sin^{12} 0 \text{ our steps}$$

$$= 7 \sin^{12} 0 \text{ our steps}$$

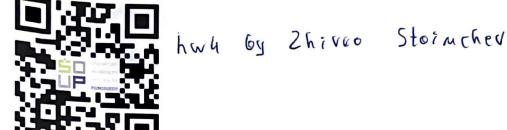

$$= 8 \cos^{12} 0 \text{ our steps}$$

$$= 8 \cos^{$$

Proof: Let 670 and Let N=10-5 Then we have n7N

 $=> n > \frac{10}{96} - \frac{5}{3} / *3$ $= 730 > \frac{10}{36} - 5$

hence | 2n - 2 | < E

B. Using the definitions of limit andlor infinite limit, show that lim Sn=w, then also limitsn=w n-ray

From Lecture Notes

From the definition of timits, for limsn=0, we have YM>0,]N s.t. [n>N] => [Sn>M] -diverges to so

For Lim Jsn we must consider an arbitrary Mye and show that there is an Ns.t.

17N => 35n 7M

=To see how big M must be, we solve for 35, >14
and get Sn7M3, thus N=M3

- Let M > 0 and N=M3

then

n>N => Sn>M3

hence 35n 7 M and also Sn > M, this shows that lim 35n = w and lim Sn = w.

C. Find the following limits. You may use any theorem we have proved, such as Arithmetic of Limits. (Please do not use any theorem not discussed in class!) Indicate clearly what results you are using. The right answer without a justifiable reason will be given zero credit.

i) $\lim_{N\to\infty} \frac{3n^2+1}{2n^2+2n-1} = \lim_{N\to\infty} \frac{n^2(3+\frac{2n}{2})}{n^2(2+\frac{2n}{2}-\frac{1}{2})} = \frac{3}{2}$

Since 3, \frac{7}{h^2}, \frac{2}{h^2}, \frac{1}{h^2} \are convergent, we get \frac{3}{2}/

 $\frac{111 \lim_{N \to \infty} \frac{\sqrt{5n^2 + 2n}}{n + 2}}{n + 2} = \frac{111 \lim_{N \to \infty} \frac{\sqrt{n^2(5 + \frac{2n}{n})}}{n(1 + \frac{2n}{n})}}{n(1 + \frac{2n}{n})} = \frac{111 \lim_{N \to \infty} \frac{\sqrt{5n^2 + 2n}}{n(1 + \frac{2n}{n})}}{n(1 + \frac{2n}{n})} = \frac{111 \lim_{N \to \infty} \frac{\sqrt{5n^2 + 2n}}{n(1 + \frac{2n}{n})}}{n(1 + \frac{2n}{n})} = \frac{111 \lim_{N \to \infty} \frac{\sqrt{5n^2 + 2n}}{n(1 + \frac{2n}{n})}}{n(1 + \frac{2n}{n})} = \frac{111 \lim_{N \to \infty} \frac{\sqrt{5n^2 + 2n}}{n(1 + \frac{2n}{n})}}{n(1 + \frac{2n}{n})} = \frac{111 \lim_{N \to \infty} \frac{\sqrt{5n^2 + 2n}}{n(1 + \frac{2n}{n})}}{n(1 + \frac{2n}{n})} = \frac{111 \lim_{N \to \infty} \frac{\sqrt{5n^2 + 2n}}{n(1 + \frac{2n}{n})}}{n(1 + \frac{2n}{n})} = \frac{111 \lim_{N \to \infty} \frac{\sqrt{5n^2 + 2n}}{n(1 + \frac{2n}{n})}}{n(1 + \frac{2n}{n})} = \frac{111 \lim_{N \to \infty} \frac{\sqrt{5n^2 + 2n}}{n(1 + \frac{2n}{n})}}{n(1 + \frac{2n}{n})} = \frac{111 \lim_{N \to \infty} \frac{\sqrt{5n^2 + 2n}}{n(1 + \frac{2n}{n})}}{n(1 + \frac{2n}{n})} = \frac{111 \lim_{N \to \infty} \frac{\sqrt{5n^2 + 2n}}{n(1 + \frac{2n}{n})}}{n(1 + \frac{2n}{n})} = \frac{111 \lim_{N \to \infty} \frac{\sqrt{5n^2 + 2n}}{n(1 + \frac{2n}{n})}}{n(1 + \frac{2n}{n})} = \frac{111 \lim_{N \to \infty} \frac{\sqrt{5n^2 + 2n}}{n(1 + \frac{2n}{n})}}{n(1 + \frac{2n}{n})} = \frac{111 \lim_{N \to \infty} \frac{\sqrt{5n^2 + 2n}}{n(1 + \frac{2n}{n})}}{n(1 + \frac{2n}{n})} = \frac{111 \lim_{N \to \infty} \frac{\sqrt{5n^2 + 2n}}{n(1 + \frac{2n}{n})}}{n(1 + \frac{2n}{n})} = \frac{111 \lim_{N \to \infty} \frac{\sqrt{5n^2 + 2n}}{n(1 + \frac{2n}{n})}}}{n(1 + \frac{2n}{n})} = \frac{111 \lim_{N \to \infty} \frac{\sqrt{5n^2 + 2n}}{n(1 + \frac{2n}{n})}}}{n(1 + \frac{2n}{n})}$

Since 1, 2, 15+2, are convergent, we get 15/ by using AoL.

111) $\lim \frac{-3n^3+4}{3n^3+2n^2-1n} = 7 \lim \frac{n^3(-3+\frac{1}{2})}{n^3(3+\frac{24}{3}-\frac{7}{2})}$

Since ±3, 43, 3, 7, -12 are convergent, by AoL

3 and we get -11

Motation: solved from the examples in Lecture Notes

hwa by Zhivko Stoimcher

D. -11- (same text as in C)

i)
$$\lim_{n\to\infty} \frac{n^2-4}{2n^3-3n+1} = 7 \lim_{n\to\infty} = 7 \lim_{n\to\infty} \frac{1-\frac{4}{n^2}}{n^3(2-\frac{3}{n^2}+\frac{1}{n^3})} = 7 \lim_{n\to\infty} \frac{1-\frac{4}{n^2}}{2-\frac{5}{n^2}+\frac{7}{n^3}} = 7 \lim_{n\to\infty} \frac{1-\frac{4}{n^2}}{2-\frac{n^2}} = 7 \lim_{n\to\infty} \frac{1-\frac{4}{n^2}}{2-\frac{5}{n^2}} = 7 \lim_{n\to\infty} \frac{1-\frac{4$$

Since
$$2n; \frac{7}{n}, 2; \frac{3}{n}$$
 are convergent, by applying AoL and Aoll that $n=\infty$.
So we have $\frac{\sqrt{2}n^3-1n}{2}$ => $2n = 2$

iii)
$$\lim_{n\to\infty} \frac{6n^2 - 2n^4}{12n^3 + 2n^2 - 17n} = 7\lim_{n\to\infty} \frac{n^4 \left(\frac{6}{n^2} - 2\right)}{n^3 \left(12 + \frac{2}{n} - \frac{17}{n^2}\right)} = 7\lim_{n\to\infty} \frac{n\left(\frac{6}{n^2} - 2\right)}{12 + \frac{2}{n} - \frac{17}{n^2}}$$

Since $\frac{6}{n^2} \cdot -2 \cdot 12 \cdot \frac{2}{n} \cdot \frac{17}{n^2}$ are convergent, by applying AoL and AolL $(n=\omega)$
we have $\frac{n(-2)}{12} = 7\frac{\omega(-2)}{12} = 7-\frac{\omega(-2)}{12}$

Notation: solved by the examples in Lecture Notes

il Suppose that the Sn satisties both lim S2n = 3 and lim Sont = 3. (That is, the sequence given by the even terms of Sn an that given by the odd terms of Sn both converge to 3.) Show that also ling Sn = 3

il Give an example of a sequence where the sequences given by the even and by the odd terms both converge, but where the critice sequence does not converge.

We have limSzn=3 and limSzn+n=3. This means they 52 are bounded by 3 and we get:

=7 Mn = Sin = Mn and m2 = Sin+1 = M2 Where M is max MyM2 and m is min My, M2.

This means that: => M = Sn = M, +n ∈ N. Sn must have limit points.

Let L be the set of limit points of Sn. thas L=3. (L=L1VL2, where L1 is the set of

We know that bounded sequence with limit point is convergent, and her 5.6 the limit is 3, therefore:

Lim Sn = 3

limit points of the psequence of even terms, and Lz is the set of limit- points of the sequence of odd terms

ii Consider $S_{n}=-1n$, such that: $S_{2n}=1$ and $S_{2n+1}=-1$

Being constant sequence, both Szn and Szizta are convergent, but Sn is not because it has two limits, 1 and -1, and for convergence the limit must be unique.
